Received 13 September 2005; revised 30 January 2006

Ranchi district of Jharkhand state is immensely rich in biodiversity and ethnomedicinal information. Ethnomedicinal survey was conducted during 2004. The information on ethnomedicinal formulation is based on the exhaustive interview with local traditional herbal practitioners and other knowledgeable persons, who prescribe their herbal preparation to treat various ailments. Twelve ethnomedicinal formulations reported in the paper includes 28 medicinal plants. These research finding need to be integrated with national healthcare systems, which requires further pharmacological validation.

Keywords: Ethnomedicine, Folklore, Traditional herbal practitioner, Ranchi, Jharkhand

IPC Int. Cl.8: A61K36/00, A61P1/02, A61P1/14, A61P1/16, A61P17/00, A61P17/02, A61P19/00, A61P19/02, A61P21/00, A61P29/00, A61P39/02

Ranchi district of Jharkhand state lies between 22° 30’N-23°30’N latitude and 85°E-86° E longitude. It is located at an altitude of 654 m above sea level. The annual average rainfall in Ranchi district is about 1530 mm. The whole district is covered by red sandy soil1,2. Jharkhand state is immensely rich in biological diversity and traditional knowledge with about 23, 605 sq km forest area, which is 29 % of the total geographic area3. It is also rich in ethnomedicine and about 80% people live in rural area. In almost each village, there is one or more traditional herbal practitioners locally called Kavirajas or Vaidyas. These traditional herbal practitioners efficiently treat various ailments with animals, plants, minerals, etc. available in their surroundings. Apart from traditional herbal practitioner, the heads of the villages also use to give some folklore medicine. The knowledge of ethnomedicine is carried out from generation to generation among ethnic people orally and the medicinal plants survived in their minds and souls4,5. Previously, workers of this area have concentrated on the documentation of the plants used by them, exploring its taxonomy6. In the paper, attempt has been made to document the folklore formulation so that in near future it may lead to the discovery of new medicines and help in protecting their IPR.

Methodology
Ethnomedicinal survey was conducted during 2004 in different blocks of Ranchi district4,7. Before launching into the fieldwork, rapport was established with the authentic person of all the blocks. The linguistic fluency, personality and social standing are crucial to establishing rapport between the participants involved. During field study, 30 medicine men approached were motivated for interview about some important folklore formulation, which they were prescribing to their patients. After documentation, use of formulations was crosschecked and confirmed. The local names of plant species were recorded. The plants were identified with the herbaria of Ranchi University, Ranchi, Jharkhand, Botanical Survey of India and different floras8,9. All the collected specimens were deposited in the herbarium of Department of Botany, Ranchi University, Ranchi for future reference.

Results and discussion
Twenty eight plant species used in 12 folklore formulations with their local names, plant parts used, quantity and mode of application for the

</table>

Chapan: The paste form of the medicine is called chapan
Goli: Some of the formulations in the tablet form were termed as goli

The treatment of various ailments/disorders have been enumerated (Table 1). The disorders include malaria, menstrual cycle disorder, toothache, leucoderma, dog bite, skin disease, vitality, joints pain and contraceptive. The knowledge of tribal people on the abortifacient and female contraceptives, which is one of the important information, is quite relevant to the present day situation. The formulation for joints pain prescribed includes Curcilogo orchioiides, Cipadessa baccifera, Moringa pterigosperma, and Canna orientalis. The rural ladies use these formulations in the form of paste. Local persons rely wholly on the traditional medicines prescribed by the local traditional herbal practitioner. These traditional medicines of indigenous origin may be integrated with national healthcare systems. Plants have been selected and used empirically as drugs for centuries, initially as traditional preparations then as pure active principles. The study is likely to promote a rational use of botanicals and must be continued focusing on isolating and characterizing the active principles of the crude extract, its pharmacological validation, standardization and formulation. It is hoped that such ethnomedicinal study will provide important database of the different folklore formulation used locally of the study area to cure different diseases.

Acknowledgement
Authors are thankful to Dr TK Ghosh and Dr CTN Singh, taxonomists for identifying the plants. Authors are grateful to the traditional healers for cooperation and sharing their precious knowledge. Authors are also thankful to the forest officers of Ranchi district for their kind cooperation and Director, PG Diploma in Medicinal Plants, University Department of Botany, Ranchi University, Ranchi, Jharkhand for financial support for survey. Thanks are due to the Ministry of HRD, Government of Jharkhand for providing one time grant for laboratory facilities.
