There are numerous beautiful lakes around the world that feature a variety of colours – far from the usual colour of water. Here are some.

**Lake Plitvice**
Lake Plitvice is a bouquet of sixteen lakes situated between the Bosnia and Herzegovina border. The beautiful lakes are mainly popular for their unique colours, including azure, green, blue, and gray. The lakes’ colouration changes constantly, depending on the quantity of minerals, deposits, or organisms in each body, or how the sun is hitting the water.

**Lake Nakuru**
Lake Nakuru is considered to be a very shallow lake in the rift valley. The huge numbers of algae in the lake attract vast quantities of lesser flamingos, sometimes more than one million at a time. Sometimes it is also called the greatest bird spectacle on earth; the flamingos literally turn the shores pink.
Havasu Falls
The Havasu Canyon is a part of the Grand Canyon inhabited by the Havasupai tribe, who live in the small town of Supai. The main reason to visit the Havasupai (which means “people of the blue-green water”) is because of the colourful waters and falls. The most spectacular of these is the Havasu Falls. The beautiful colour of the water is caused by carbonate minerals settling to the bottom, turning it white, and acting as a reflector of the surrounding green and brown mossy cliffs plus the blue sky.

Band-e Amir
Band-e Amir is a chain of six deep blue lakes situated high in the Hindu Kush Mountains of Central Afghanistan. The marvellous lakes were formed from mineral-rich water that seeped out of faults and cracks in the rocky landscape. The lakes’ high mineral content is also the cause for the intense and varying colours of the lake waters.
