Supplementary Figure

Suppl. Fig. 1— Antiproliferative assay using yeast (*Saccharomyces cerevisiae*) model. Images showing effect of seed extracts of *Cucurbita pepo* (CP), *Cucumis melo* (CM) and *Cucumis sativus* (CS), control group on morphology mode over 96 h time period. All the plant extracts showed good inhibition of yeast cell growth. The degree of cell growth inhibition was directly proportional to concentration of plant extracts.
