The three component condensation of an aldehyde 1, urea/thiourea 2 and β-ketoester 3/dimidone 7 in the presence of a catalytic amount of VOSO₄ is disclosed for the synthesis of 3,4-dihydro-1H-pyrimidine-2-thione (DHPMs) 4 and octahydro-2,5-quinazolinedione 8 under solvent-free microwave irradiation conditions. High yields are achieved even on 1 g scale, while reaction times are considerably shortened compared to conventional heating conditions.

Keywords: VOSO₄ catalyst, dihydro-1H-pyrimidine-2-thione/one, octahydro-2,5-quinazolinedione, solvent-free, microwave irradiation

Development of a simple, safe, ecofriendly and economic synthetic routes for widely used organic compounds from the readily available reagents are one of the major challenges in organic synthesis. 3,4-Dihydro-1H-pyrimidine-2-thione esters (DHPMs) are among such type of organic compounds which belong to an important class with significant therapeutic and medicinal properties, some of which have antiviral, antitumor, antibacterial and anti-inflammatory activity. Several marine alkaloids having the DHPM core unit are showing interesting biological activities such as calcium channel blockers, antihypertensive agents and α-1a-adrenoreceptor antagonists. The structurally rather simple DHPM monastrol (Figure 1) specifically inhibits the mitotic kinesin Eg5 motor protein and can be considered as a new lead for the development of anticancer drugs. The batzelladine alkaloids (Figure 1) containing the DHPM core unit inhibit the binding of HIV envelope protein gp-120 to human CD4 cells and, therefore, are potential new leads for AIDS therapy. Therefore, the synthesis of compounds with DHPMs core unit has gained much importance. Although many synthetic methods have been developed, most of these methods suffer from one or the other disadvantages such as long reaction times, harsh reaction conditions, and the use of stoichiometric reagents or of toxic and inflammable solvents, difficult work-ups or low yields of products. Hence, it is desirable to develop an easy, safe and economical procedure, avoiding strong acids, hazardous or expensive reagents and other corrosive media. In this regard vanadium (IV) is used as a catalyst for the synthesis of DHPMs as it participates as a catalyst in important biological processes, and also has been used as a catalyst for organic reactions such as coupling reactions, oxidation of sulphides, cyclooctene and sugars, epoxidation of cyclohexene, stabilization of enolates and other reactions.

In continuation of our interest to develop new methodologies in organic reactions, in this communication, a simple and effective Biginelli reaction that produces high yields of DHPMs in a short reaction time is disclosed under solventless microwave irradiation using a catalytic amount of VOSO₄, while preserving the original one-pot strategy.

In order to explore the catalytic activity of VOSO₄ and also the effect of microwave irradiation of the Biginelli reaction, a mixture of benzaldehyde, ethyl acetoacetate, urea (1.1:1.0:2.0 molar ratio) and a catalytic amount of VOSO₄ was irradiated under solventless microwave irradiation conditions at 360 W for 3 min, which gave 4a in an excellent yield. Under similar conditions, different substituted aldehydes were converted to their corresponding DHPMs (Scheme I) in good yields and the results are summarized in Table I.

The important features of microwave/VOSO₄ mediated Biginelli protocol are: In many cases the product obtained is at least 95% purity, high yields, survival of a variety of functional groups such as methoxy, halide, and nitro. In fact, the aliphatic aldehydes were converted to their corresponding DHPMs (Scheme I) in good yields and the results are summarized in Table I.

This reaction was further explored for the synthesis of octahydro-2,5-quinazolinedione 8 by the reaction of aldehyde 1 urea 2 and dimidone 7 under similar reaction conditions, compound 8 was obtained in excellent yields (Scheme III).

In conclusion, a simple, in-expensive, efficient and solvent-free microwave induced method for the Biginelli condensation using VOSO₄ catalyst has been developed. The advantages of this environmentally benign and safe protocol include a simple reaction setup, high yields, shorter reaction times, simple work-up and also have the ability to tolerate a wide variety of substituents in all the three components, which makes it a useful process for the synthesis of DHPMs.

**Experimental Section**
Melting points were uncorrected and were determined in open glass capillaries on Fisher-Johns apparatus. IR spectra (KBr) were recorded on a
Perkin-Elmer spectrum BX series FT-IR spectrometer. $^1$H NMR spectra were obtained on a Varian Gemini (300 MHz) spectrometer. TMS was used as an internal standard and CDCl$_3$/DMSO-$d_6$ as the solvent. Mass spectra were recorded on a VG-Micromass 7070H spectrometer operating at 70 eV. Elemental analyses were performed on a PerkinElmer 240 CHN elemental analyzer. VOSO$_4$ is procured from Aldrich chemical company. All the aldehydes, $\beta$-ketoesters, dimidone and urea/thiourea...
are commercially available. For the microwave irradiation, a conventional house hold microwave oven was used.

Synthesis of ethyl-6-methyl-2-oxo-4-phenyl-1,2,3,4-tetrahydro-5-pyrimidine carboxylate 4a: A mixture of benzaldehyde 1 (1.11 mL, 0.01 mole), urea 2 (1.2 g, 0.02 mole) and β-ketoester 3 (1.45 mL, 0.011 mole) was mixed with VOSO₄ (11 mg, 5 mole %) in a glass tube and placed the tube at the center of an alumina-bath, kept inside a microwave oven and the mixture was irradiated at 360W microwave power for the specified time (Table I). On completion of the reaction, indicated by TLC, the mixture was cooled and quenched with water. The solid separated was filtered and recrystallized from ethanol to afford pure, DHPMs 4 in good yields. The other compounds 4b-t were prepared by similar procedure. Ethyl-4-(3,4-dimethoxyphenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydro-5-pyrimidine carboxylate 4g: m.p. 182-84°C; ¹H NMR (CDCl₃ + DMSO-d₆): δ 9.16 (s, 1H), 7.51 (s, 1H), 6.84 (d, 1H, J = 8.1 Hz), 6.90 (s, 1H), 6.62 (d, 1H, J = 8.1 Hz), 5.22 (d, 1H, J = 3.4 Hz), 4.04 (q, 2H), 3.67 (s, 6H), 2.28 (s, 3H), 1.12 (t, 3H); IR (KBr): 3350, 3236, 2965, 1720, 1645, 1220 cm⁻¹; Mass: m/z 320 (M⁺). Anal. Calcd. for C₁₆H₂₀N₂O₅: C, 59.99; H, 6.29; N, 8.74. Found: C, 59.71; H, 6.32; N, 8.69%.

Ethyl-4-(3,4-dimethoxyphenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydro-5-pyrimidine carboxylate 4g: m.p. 182-84°C; ¹H NMR (CDCl₃ + DMSO-d₆): δ 9.16 (s, 1H), 7.51 (s, 1H), 6.84 (d, 1H, J = 8.1 Hz), 6.90 (s, 1H), 6.62 (d, 1H, J = 8.1 Hz), 5.22 (d, 1H, J = 3.4 Hz), 4.04 (q, 2H), 3.67 (s, 6H), 2.28 (s, 3H), 1.12 (t, 3H); IR (KBr): 3350, 3236, 2965, 1720, 1645, 1220 cm⁻¹; Mass: m/z 320 (M⁺). Anal. Calcd. for C₁₆H₂₀N₂O₅: C, 59.99; H, 6.29; N, 8.74. Found: C, 59.71; H, 6.32; N, 8.69%.

Ethyl-6-methyl-2-oxo-4-[((E)-2-(4-methylphenyl)-1-ethenyl]-2-oxo-1,2,3,4-tetrahydro-5-pyrimidine carboxylate 4p: m.p. 189-91°C; ¹H NMR (CDCl₃ + DMSO-d₆): δ 9.92 (s, 1H), 9.74 (s, 1H), 7.00-7.40 (m, 5H), 6.01 (d, 1H, J = 5.62 Hz), 4.80 (d, 1H, J = 5.62 Hz), 4.05 (q, 2H), 2.32 (s, 3H), 2.02 (s, 3H), 1.10 (t, 3H); IR (KBr): 3340, 3252, 2965, 1720, 1645, 1595, 1226 cm⁻¹; Mass: m/z 300 (M⁺). Anal. Calcd. for C₁₇H₂₀N₂O₃: C, 67.98; H, 6.70; N, 9.17%.

Ethyl-4-(2,2-diphenylvinyl)-6-methyl-2-oxo-1,2,3,4-tetrahydro-5-pyrimidine carboxylate 4q: m.p. 238-40°C; ¹H NMR (CDCl₃ + DMSO-d₆): δ 9.91 (s, 1H), 9.57 (s, 1H), 7.47-7.82 (m, 10H), 6.47 (d, 1H, J = 5.52 Hz), 4.51 (d, 1H, J = 5.52 Hz), 3.99 (q, 2H), 2.32 (s, 3H), 1.10 (t, 3H); IR (KBr): 3320, 3245, 2945, 1720, 1640, 1596, 1226 cm⁻¹; Mass: m/z 362 (M⁺). Anal. Calcd. for C₂₂H₂₂N₂O₃: C, 72.83; H, 6.02; N, 7.66%.

The other products reported in Table I are known compounds for which satisfactory spectroscopic data were obtained.

General procedure for the synthesis of octahydro-2,5-quinazolinedione 8: A mixture of benzaldehyde/4-methoxybenzaldehyde 1 (1.11 mL/1.47 mL, 0.01 mole), urea 2 (1.2 g, 0.02 mole) and dimidone 7 (1.68 g, 0.012 mole) was mixed with VOSO₄ (11 mg, 5 mole%) in a glass tube and irradiated in a microwave oven at 360 W for 5 min. On completion of the reaction, indicated by TLC, the mixture was cooled and quenched with water. The solid separated was filtered and recrystallized from ethanol to afford pure 8 in good yields.

7,7-Dimethyl-4-(4-methoxyphenyl)-1,2,3,4,5,6,7,8-octahydro-2,5-quinazolinedione 8a: m.p. 166-68°C; ¹H NMR (CDCl₃ + DMSO-d₆): δ 7.12-7.39 (m, 5H), 6.24 (s, 1H), 5.96 (d, 1H, J = 5.2 Hz), 5.29 (s, 1H), 2.38-2.50 (m, 6H), 1.1 (s, 6H); IR (KBr): 3347, 3068, 1682, 1610 cm⁻¹; Mass: m/z 270 (M⁺). Anal. Calcd. for C₁₈H₁₈N₂O₃: C, 71.09; H, 6.71; N, 10.36. Found: C, 71.12; H, 6.82; N, 10.17%.

4-(4-Methoxyphenyl)-7,7-dimethyl-1,2,3,4,5,6,7,8-octahydro-2,5-quinazolinedione 8b: m.p. 142-44°C;
1H NMR (DMSO-d$_6$): δ 6.98 (d, 2H, $J = 8.44$ Hz), 6.86 (d, 2H, $J = 8.44$ Hz), 6.23 (s, 1H), 5.87 (d, 1H, $J = 5.2$ Hz), 5.42 (s, 1H), 3.82 (s, 3H), 2.48-2.62 (m, 4H), 1.0 (s, 6H); IR (KBr): 3400, 3069, 1682, 1595, 1457, 1371 = 5.2 Hz), 5.42 (s, 1H), 3.82 (s, 3H), 2.48-2.62 (m, 4H), 1.0 (s, 6H); IR (KBr): 3400, 3069, 1682, 1595, 1457, 1371 Hz, 5.42 (s, 1H), 3.82 (s, 3H), 2.48-2.62 (m, 4H), 1.0 (s, 6H); IR (KBr): 3400, 3069, 1682, 1595, 1457, 1371
